TRIPLE THREAD LABS

FREE SETUP GUIDE

YOUR SHOP ASSISTANT

Turn the AI app already on your phone into a pricing helper for your embroidery shop. It asks for your numbers, prices one job at a time, and shows the math on every price.

Set it up in about **15 minutes**. No new software, no spreadsheet, nothing to install. If you can answer a few questions about your shop, you can run this.

WHAT YOU'RE GETTING

A PRICING HELPER THAT LIVES IN YOUR AI APP

PRICES ONE JOB AT A TIME

Tell it the job: the garment, the stitch count, the quantity. It asks for anything that is missing, then gives you a price per item and a total for the whole job.

BUILT ON YOUR NUMBERS

It interviews you first: your labor rate, your supplies, your overhead, the margin you want. Your prices come from your shop, not from a stranger's rate card.

SHOWS ITS WORK

Every price comes with the breakdown in plain lines: blank, supplies, run time, labor, overhead, margin. You can check each line before you quote anyone.

PLAIN ENGLISH, START TO FINISH

No formulas to learn and no settings buried in menus. You answer questions the way you would explain the job to another shop owner, and talk to it the same way.

HONEST LIMITS, UP FRONT

This free version prices **one job at a time**, and a new chat forgets your numbers, so you will type them again. It is a helper, not a saved system. **Check every price before you send it.** The tool that remembers your numbers and does this exactly is on the last page.

BEFORE YOU START, YOU NEED 3 THINGS

AN AI APP

Claude or ChatGPT. The free version is fine to start.

YOUR SHOP NUMBERS

What you pay for blanks and supplies, roughly what an hour of your time is worth, and the margin you want. Rough is okay.

15 MINUTES

Most of it is just answering questions about your shop.

HOW TO SET IT UP

THREE STEPS, THAT'S IT

1 OPEN YOUR AI APP

Open Claude or ChatGPT and start a brand new chat. A fresh chat matters: the setup box needs a clean start so nothing from an old conversation gets mixed into your prices.

2 PASTE THE SETUP BOX

The box on the next page is the whole setup. Copy all of it, paste it into the new chat, and send it. You do not need to type anything else or change any settings.

3 ANSWER ITS QUESTIONS

It will interview you one question at a time, then ask about a real job and price it with you. Use a job you already know, so you can sanity check the first price it gives you.

THE INTERVIEW, SO NOTHING SURPRISES YOU

- What you charge for one hour of your time
- What stabilizer, thread and other supplies cost you per item
- How much overhead you want to add to each item
- The margin you want, as a percent of the selling price

Then, for each job: the blank and what it costs you, the stitch count, how many items, how many hoopings, and whether it came through a marketplace that takes a fee.

Tip: if you do not know a number, say so. The assistant will help you pick a starting point and will label it as a starting point every time it uses it. A labeled guess you can fix later beats a made up number hiding inside a price.

→ THE SETUP BOX IS ON THE NEXT PAGE

STEP 2 · THE SETUP BOX

PASTE THIS INTO A NEW CHAT

Copy the entire box below into a new Claude or ChatGPT chat and send it. You don't need to type anything else.

✂ COPY THIS WHOLE BOX · PASTE & GO

```
You are my pricing helper for my embroidery shop. Help me price ONE job at a time, with the math shown, using my numbers only.

Start by interviewing me about my shop. Ask ONE question at a time, in plain words: (1) What do I charge for one hour of my time? (2) What do stabilizer, thread and other supplies cost me per item? (3) How much overhead do I want to add to each item? (4) What margin do I want, as a percent of the selling price?

Then ask me about the job: the blank or garment and what it costs me, the stitch count, how many items, how many hoopings, and whether the job came through a marketplace that takes a fee, and what percent. If anything is missing, ask before you price. Never guess a number I did not give you. If I don't know a number, help me pick a starting point, and label it "starting point" every time you use it.

Price the job this way: 1) Start with the blank or garment cost per item. 2) Add my supplies cost per item. 3) Run time in minutes is the stitch count divided by 850. Use at least 10 minutes, for hooping and setup. Add 5 minutes for each extra hooping after the first. 4) Labor is run time divided by 60, times my labor rate. 5) Add my overhead per item. 6) That total is my cost per item. My selling price per item is the cost divided by (1 minus my margin percent). If there is a marketplace fee, divide again by (1 minus the fee percent).

Show me every line of the math, then give me three numbers: my cost per item, my price per item, and the price for the whole job. Keep your answers short and plain. If my numbers would price a job below my cost, stop and tell me before you give a price. When I say "new job," forget the old job and ask me about the new one. My shop numbers stay the same unless I change them.
```

ONCE IT'S RUNNING

JUST TALK TO IT

Keep the same chat open for your shop and say what you need in plain words. A few ways owners actually use it:

"Price this job."

Then describe it: 24 polos, left chest logo, about 8,000 stitches, one hooping. It asks for anything missing and prices it.

"What am I forgetting?"

Ask before you quote. It checks the job against the costs shops usually leave out, like setup time and a second hooping.

"Reprice that last job."

Blank went up two dollars? Say so, and it runs the same job again with the new number, same math.

"Check my price."

Give it a price you already quoted and your numbers. It works backwards and shows you the margin you actually left yourself.

WHAT A FINISHED PRICE LOOKS LIKE

Example job, with example numbers: 6 hoodies, a 12,000 stitch front design, one hooping. The owner charges $40 an hour, wants a 40% margin, and adds $5 of overhead per item.

Blank hoodie	**$18.00**
Stabilizer and supplies	**$2.50**
Run time: 12,000 stitches ÷ 850, about 14 minutes	
Labor: 14 minutes at $40 an hour	**$9.41**
Overhead	**$5.00**
Cost per hoodie	**$34.91**
Price per hoodie, and for all 6	**$58.18 · $349.08**

If a price looks wrong, say so. The math is shown on purpose, so you can catch a wrong stitch count or a blank cost that changed. Never send a price to a customer that you have not read first. You are still the shop owner. This just does the arithmetic.

YOU'RE SET.
GO PRICE THE NEXT ONE.

Your assistant stays in that chat. Open it any time, say "new job," and price the next one. If the chat ever gets lost, come back to page 4, paste the box into a fresh chat, and answer the interview again.

> I run a small embroidery shop here in Raleigh, and I priced by gut for longer than I want to admit. The jobs I lost money on were never the hard ones. They were the quick ones I never ran the numbers on.

WHEN TYPING YOUR NUMBERS AGAIN GETS OLD

SHOP SUITE PRO

- **It remembers your shop.** Enter your numbers once. They save on their own and every job uses them.
- **The math is exact.** Embroidery and DTF calculators, with no arithmetic to double check.
- **It goes past the price.** Turn the price into a PDF quote, track the order, and keep customers and inventory in the same file.

Runs on your Windows or Mac computer, even offline. Not for phones or tablets. No subscription and no account.
